with series resistors

Instructions In the case of group compensation multi-stage capacitor banks are connected to the mains, as required. Transient currents of up to $180 \times$ le could flow between the capacitors. The capacitors are pre-charged via the early-make auxiliary contacts and the fitted wire resistors, thereby reducing the inrush current. The main contacts then close in a time-delayed manner and bring about the continuous current. Due to their special contacts, the contactors for the capacitors are weld-resistant for capacitors with inrush current peaks Due to their special contacts, the contactors for capacitors are weld-resistant for capacitors with inrush current peaks up to $180 \times \mathrm{I}_{\mathrm{e}}$.
